

True/False Quiz: Frontotemporal Degeneration (FTD)

Question 1: Frontotemporal Degeneration (FTD) primarily affects the frontal and temporal lobes of the brain.

Question 2: FTD is most common in individuals over the age of 70.

Question 3: Behavioral Variant FTD (bvFTD) often presents with changes in personality and social behavior.

Question 4: Memory loss is the first and most prominent symptom of FTD.

Question 5: Genetic mutations, such as those in the GRN or MAPT genes, can cause FTD.

Question 6: Nonfluent/Agrammatic Primary Progressive Aphasia (PPA) affects language production.

Question 7: Antidepressants are sometimes used to manage behavioral symptoms in FTD.

Question 8: MRI scans can detect brain atrophy in the frontal and temporal lobes, helping diagnose FTD.

Question 9: Frontotemporal Degeneration (FTD) progresses at the same rate in all individuals.

Question 10: Caregiver education and support are important for managing FTD care.
